                                                                                                                                                                                                           NOTE: This is a 'working draft' sequence. It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

1 134419: contig of 134419 bp in length.

This sequence encodes the protein of the invention. The protein of the invention is a beta-2 adrenalin receptor subtype with Kd value of approximately 75 pM against 1251-cyanopindrol. The protein can be used screening for agonists and antagonists, which are useful in researching asthmatic diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Вþ
                                                                                                                          Transments for obesity in dogs processed e.g. The sequence was isolated from a cDNA library receptor (RA-Ca-b2) gene. The sequence was isolated from a cDNA library receptor (RA-Ca-b2) gene. The sequence was isolated from a cDNA library receptor (RA-Ca-b2) gene. The sequence was isolated from a cDNA library receptor (RA-Ca-b2) gene. The sequence was isolated from a cDNA library receptor (RA-Ca-b2) gene. The sequence was isolated from a cDNA library receptor constructed from polyA+ RNA purified from dog brown adipose tissue cells. Constructed from polyA+ RNA purified from dog brown adipose tissue cells. The probe was a 600 bp fragment of the coding region of the human beta-3 constructed from covering the region from the initiation codon to adrenergic receptor covering the region from the initiation codon to transmembrane domain 5 (TM5). The full length insert was cloned into M13 cresquencing using primers v30491-v30510. The sequence can then be for sequencing using primers v30491-v30510. The sequence can then be repressed e.g. in a mammalian cell, by subcloning into an expression comparative studies, e.g. for differential screening of ligands specific for RA-Ca-b2 or RA-Ca-b3 (W44933).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel beta-2 adrenalin receptor sub-type - useful for screening agonists and antagonists and researching asthmatic diseases claim 5; Page 23-26; 47pp; Japanese. Claim 5; Page 23-26; 47pp; Japanese. This sequence encodes the protein of the invention. The protein invention is a beta-2 adrenalin receptor subtype with Kd value of approximately 75 pM against 1251-cyanopindrol. The protein can be approximately 75 pM against 1251-cyanopindrol. The protein can be screening for agonists and antagonists, which are useful in reseasthmatic diseases.

CC operon, which determines resistance to the antimycobacterial drug CC ethambutol (EMB). It includes the embA, embC and embb genes that CC encode proteins (see W73052-54) which are the target of action of CC M. smegmatis for EMB. To identify genes conferring EMB resistance, CC a genemic library from a high level EMB-resistant mutant of M. smegmatis was introduced into wild type M. smegmatis mc2155. Four CC overlapping cosmids were identified which conferred a resistant CC overlapping cosmids were identified which conferred a resistant CC esistance was 9 kb (pIMM99). pIMM99 plus 7 kb upstream M. CC smegmatis sequence was dequences revelaing 3 homologous open CC resistance (embC, embB) and 4 additional potential coding CC regions. Wild-type and mutated embCAB nucleic acid sequences are CC usefil as probes used in the diagnosis of drug-resistant CC mycobacteria or to determine the susceptibility of mycobacteria to CC EMB. The nucleic acids are also useful in the treatment of compobacterial infections; anti-DNA or anti-RNA sequences can be CC administered to inhibit embCAB operon mRNA activity (claimed). The CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines, or to improve existing CC uncleic acid sequences as vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       excessive activity is associated with restenosis, atherosclerosis, congestive heart failure, chronic obstructive pulmonary disease, benign prostatic hypertrophy, glomerulconephritis, nephritis, fibrosis, gliosis, cirrhosis and anomalous wound healing (e.g. keloids). Disease or susceptibility to disease related to expression or activity of hC/BTLP can be diagnosed by detecting a mutation in the gene encoding hC/BTLP. Polypeptides and polynucleotides of hC/BTLP can be used in the treatment of the above diseases.

Example 1; Page 57-62; 105pp; English.

A previously described large open reading frame (T45828) for hepatitis GB virus (HGBV) isolate C genotype 1 is provided. The availability of HGBV nucleic acid sequences (see also T45836) obtd.

e.g. by PCR amplification, permits the construction of expression vectors encoding antigenically active regions of the HGBV protein (see also W06536). Novel recombinant HGBV polypeptides are useful as immunoassay reagents for HGBV antigens or antibodies. They can also be used in vaccine prodn., to determine clearance of HGBV from an infected patient, and to raise antibodies.

Sequence 9126 BP; 1611 A; 2514 C; 2913 G; 2070 T;
        Oligo.nucleotide(s) specific for hepatitis GB virus-C, useful as probes and primers - for diagnosis, screening blood etc. and design of specific poly; peptide(s)

Example 1; Page 51-56; 96pp; English.

The invention relates to nucleic acid sequences derived from a novel Hepatitis GB virus (HGBV), a form of non-A to-non-E hepatitis, especially the C serotype of the virus. This sequence represents the NS3 region of the virus genome. The probe (corresponding to bases 4245-4432) can be used to detect, by hybridisation, the presence of HGBV-C serotype nucleic acids in a sample following by RT-PCR amplification of the viral genome.
                                                                                                                                                                                                                                                                                                                                                                                                             Fragment of HGBV NS3 genomic region.

CC The present sequence is of a human tolloid-like (mTll) cDNA. This cc sequence was derived from clones isolated from a human placenta genomic CC library. The human Tll gene maps to the 4925-4qter region on chromosome CC 4. As the human Tll gene maps to the 4925-dqter region on chromosome CC protein (mTl), it is expected to be a protease having a key role in CC development and homeostatic processes such as wound healing. The CC invention claims that human Tll protein can be used for promoting CC maturation of extracellular matrix precursors into macromolecular CC structures, for activating growth factors in vivo and in vitro and for accelerating developmental and homeostatic processes when administered CC to a tissue. Human Tll protein may also be used to develop inhibitors CC against lite enzymatic activity. Such inhibitors would be useful in CC preventing fibrosis and excess scarring or other abnormalities of wound CC human Tll (W40226) can be used in assays for visualising the production and localisation of mTll protein in cells and tissues.

The proteins are us the fields of petroleum purification, chemical industry and drug industry related to the synthesis, conversion and decomposition aromatic compounds.

PS Claim 1; Page 988; 2245pp; Japanese.
Cd obble-stranded DNA (or its complementary strand or the corresp.
Cd obble-stranded DNA) which comprises one of the 7837 "GS" sequences
Cd 91ven in T19001-T26837 and which is able to hybridise to part of
Cd 91ven in T19001-T26837 and which is claimed. The GS (Gene Signature)
CC 20 chuman genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature)
CC 30 cent of mRNA by using poly(T) as the sole primer. Since the 30 cent untranslated sequence is unique to a particular mRNA species, almost
CC 11 the 30 coriented CDNAs hybridise with specific mRNAs. Each library
CC 12 constructed so as to reflect accurately the relative abundance of
CC 13 constructed so as to reflect accurately the relative abundance of
CC different mRNAs in the particular tissue from which it was derived.
CC determined (esp. using primers and probes derived from the GS
CC sequences) as a means of diagnosing abnormal cell function or for
CC crecognising different cell types.
CC Sequence 323 BP; 111 A; 47 C; 63 G; 95 T;

This sequence encodes an amino acid sequence which is responsible for one of the steps in microsporogenesis, which is responsible for one of the steps in microsporogenesis a specifically tassel development. This CDMA was isolated from a specifically tassel development which is normally male sterile CDNA into a plant, pref. maize, which is normally male sterile causes it to be fertile. Such transformed plants may be used as female parents in the production of hybrid seeds. Sequence 1419 HP; 304 A; 387 C; 473 G; 255 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US5824524-A.

Production of male-sterile plants -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zea
                                                                                                                                                                                                                                                                                                                                                                fertility gene
Claim 2; Column 37-40; 40pp; English.
Claim 2; Column 37-40; 40pp; English.
The maize male fertility gene MS45 can be repressed as a method for mediating male fertility in a plant. This method can be used especially mediating hybrid maize seed. The endogenous gene can be inactivated and the control of an inducible promoter can be used to specifically activate the gene when fertile plants are desired.
